# High Throughput Computing in bioinformatics

**workflows, containers and emerging paradigms**

Peter van Heusden [pvh@sanbi.ac.za](mailto:pvh@sanbi.ac.za)  
South African National Bioinformatics Institute

---

# **GETTING THE MOST OUT OF COMPUTING (FOR RESEARCH)**

# Scaling up computing

---

From

TO

# Computing types

- Our challenge: how to make use of computers working together to tackle large compute tasks...

**high-throughput**

**high-performance (e.g. MPI)**

# Two Strategies

---

## Cloud

Focus: Service *many user groups* by providing *generic* computing

Skills focus: *systems* engineering to create *virtual infrastructure*, compose *multiple component* services

## HPC Cluster

- Focus: Service *specialised* computing groups working on *computationally challenging* problems
- Skills focus: *research* software engineering and *parallel algorithms*

# The Research Computing Stack

---

# Research Computing Roles

---

# Two Architectures

---

## High Throughput

Focus: Workflows with many *small, largely independent* compute tasks

Optimize: *throughput*, or time from *submission* to *overall completion*

## High Performance

- Focus: Workflows with *large, highly coupled* tasks
- Optimize: *individual tasks*, software, communication between processes

# Making Good Choices

---

- How do you choose the best approach?
- Guiding question:

Is your problem “HTC-able”?

# Typical HTC Problems

---

- batches of similar program runs ( $>10$ )
- “loops” over independent tasks
- others you might not think of ...
  - programs/functions that
    - process files that are already separate
    - process columns or rows, separately
    - iterate over a parameter space
  - *a lot* of programs/functions that use multiple CPUs on the same server

**Ultimately: Can you break it up?**

# What is not HTC?

---

- fewer numbers of jobs
- jobs individually requiring significant resources
  - RAM, Data/Disk, # CPUs, time  
(though, “significant” depends on the HTC compute system you use)
- restrictive licensing

# HTC Bioinformatics

---

Steps to HTC:

Automate on each layer

- Software defined infrastructure
- Software dependency management
- Workflows
- Reference data collections
- End user usability

# HTC on a Cluster (1)

---

- Software provisioning:
  - Conda / bioconda: consistent installation
    - Environment modules - lacks naming consistency
  - Containerisation:
    - Singularity (biocontainers)

# HTC on a Cluster (1)

---

- Software provisioning:
  - Conda / bioconda: consistent installation
    - Environment modules - lacks naming consistency
  - Containerisation:
    - Singularity (biocontainers)
- Workflows
  - “Custom scripts” limit re-use and waste effort
  - Many command line options:
    - Nextflow
    - Snakemake
    - Common Workflow Language (CWL) with Toil
  - Galaxy front-end, cluster back-end
    - Works well, **not** tuned for multi-tenant clusters
    - No shared filesystem? Galaxy-Pulsar

# HTC on a Cluster (2)

---

- Data provisioning:
  - Mostly an unsolved problem
  - Galaxy solution: reference data via CVMFS

# HTC on a Cluster (2)

---

- Data provisioning:
  - Mostly an unsolved problem
  - Galaxy solution: reference data via CVMFS
- End-user usability
  - Commandline high cost of entry for users
  - Training is largely specific to single cluster
    - Trying to address that with “modular” training materials at HPC Carpentry (Thursday)

# HTC on a Cluster: Demo

---

- Demonstrated at CHPC Conf 2016
  - CommonWL with cwltool - SANBI / CHPC
- H3ABionet Hackathon (Aug 2016)
  - 4 workflows in 1 week
  - Nextflow & CWL
  - [http://bit.ly/h3a\\_wf\\_scidataconf18](http://bit.ly/h3a_wf_scidataconf18)
  - [http://bit.ly/h3ahack\\_paper](http://bit.ly/h3ahack_paper)

# HTC on a Cloud (1)

---

- Infrastructure provisioning
  - Software defined infrastructure
  - System software deployed via images
  - System configuration

# HTC on a Cloud (1)

---

- Infrastructure provisioning
  - Software defined infrastructure
  - System software deployed via images
  - System configuration
- Software provisioning
  - Conda / bioconda
  - Containerisation
- Workflows
  - “Virtual cluster”
  - Galaxy front-end, cluster back-end (HTCondor)
    - experimental: Kubernetes back-end

# HTC on a Cloud (2)

---

- Data provisioning
  - Still a mostly unsolved problem
  - Use S3 semantics: objects + metadata
  - Inherently multi-tenant: move analysis to data
- End-user usability
  - Provide a higher level of abstraction
  - Build on consistent training materials / community

# HTC on a Cloud (Ilifu) Demo

The screenshot displays the Galaxy web interface. The top navigation bar includes 'Galaxy', 'Analyze Data', 'Workflow', 'Visualize', 'Shared Data', 'Admin', 'Help', 'User', and a grid icon. The user's session is noted as 'Using 18.2 MB'.

**Tools Panel (Left):** A sidebar with a search bar and a list of tool categories: Get Data, Send Data, Collection Operations, Lift-Over, Text Manipulation, Convert Formats, Filter and Sort, Join, Subtract and Group, Fetch Alignments/Sequences, Operate on Genomic Intervals, Statistics, Graph/Display Data, Phenotype Association, Bacterial Variant Calling, Spoligotyping, Sequence Quality Control, and Workflows (with a link to 'All workflows').

**Main Panel:** The 'MultiQC aggregate results from bioinformatics analyses into a single report (Galaxy Version 1.6)' tool interface. It features an 'Options' dropdown and a 'Results' section. Under '1: Results', the 'Which tool was used generate logs?' dropdown is set to 'Bamtools'. The 'Output of BAMtools' section shows a list of files, with '101: MultiQC on data 59, data 58, and others: Webpage' selected. Below this, a note states 'It should contain "Stats for BAM file(s)"'. The 'Report title' field is empty, with a note 'It is printed as page header'. The 'Custom comment' field is also empty, with a note 'It will be printed at the top of the report'. The 'Output the multiQC log file?' section has 'Yes' and 'No' radio buttons, with 'Yes' selected. A note below says 'This is mostly useful for debugging purposes'. An 'Execute' button is at the bottom.

**History Panel (Right):** A sidebar showing a list of recent jobs. The top job is '101: MultiQC on data 59, data 58, and others: Webpage' (18.04 MB). Other jobs include '100: MultiQC on data 59, data 58, and others: Stats', '85: snippy\_mod on collection 15 snps table', '84: snippy\_mod on collection 15 snps vcf file', '63: Mycobacterium tuberculosis h37rv.GCA\_000195955.2.29.dna.chromosome.Chromosome.fa', '60: data 45, data 43, and others (flattened)', '17: FastQC on collection 15: RawData', '16: FastQC on collection 15: Webpage', and '15: 7 samples'.

**What it does:** MultiQC aggregates results from bioinformatics analyses across many samples into a single report. It takes results of multiple analyses and creates a report that can be viewed as a single beautiful web-page. It's a general use tool, perfect for summarizing the output from numerous bioinformatics tools.

**Inputs:** MultiQC takes software output summaries/logs and creates a single report from them. You need to tell the tool which software was used to generate the report. This is done using the **Software name** dropdown. At present only the Galaxy tools found in the ToolShed produce logs that can be used with MultiQC.

The first integration of this tool was made by Cyril Monjeaud and Yvan Le Bras ([Enancio](#) and Rennes GenOuest Bio-informatics Core Facility). It is now maintained by the [Intergalactic Utilities Commission](#).

# The Future

---

- Convergence of technologies for:
  - Software deployment
  - Data management and deployment
  - Workflows

# The Future

---

- Convergence of technologies for:
  - Software deployment
  - Data management and deployment
  - Workflows
- Challenges of convergence
  - Who will engineer cross-institutional projects?
  - Where and how will users learn / be trained?

# Thanks
